

Primrose (Primula)- a flower that occurs mainly in Europe and Asia in areas with temperate climates, mostly in the Himalayas and China. Some of its species occur up to the mountains of New Guinea. These flowers date back to 10-70 cm high, of varying habit, elongated leaves, or ovate, often mossy, forming a rosette. The flowers are different colors, a funnel or bell-shaped crown, seated alone, often collected in a inflorescence (spike, umbel, a cluster). Primrose is both protected and belongs to the family Primulaceae, including approximately 550 species of perennials. In Poland 7 species grows wild primroses, among others amounted to (elator).The best known species primroses primrose is a doctor (Primula Versi L.), which has medicinal properties, it is how a decorative plant like the rest of his brethren.
